

Scenario 1:

You are using ChatGPT API to create a customer support chatbot. Users often ask for the latest offers, but the chatbot gives old information.

Question:

How can you fix this issue?

1. Implement RAG in the code
2. Latest data will be referred
3. Latest offers will be displayed.

Scenario 2:

A chatbot is recommending random products even though users give clear preferences.

Question:

How will you improve the chatbot's recommendations?

1. RAG will be implemented
2. Give the correct context to the chatbot to give clear preferences

Scenario 3:

A finance chatbot using ChatGPT API sometimes gives different answers for the same question.

Question:

What can you do to make the chatbot more consistent?

1. To avoid randomness in the result low the temperature parameter which is given to the model
2. Give the correct context to the chat bot to give clear answers.

Scenario 4:

A legal chatbot answers general questions well but struggles with specific case-related queries.

Question:

How can you make it give more accurate answers?

1. RAG will be implemented in the chat bot
2. Knowledge document will be updated with legal cases
3. To reduce randomness set low temperature
4. Give the correct context to the chat bot to give clear answers

Scenario 5:

A healthcare chatbot sometimes gives incorrect medical advice.

Question:

How will you ensure safe and accurate responses?

1. RAG will be implemented in the chat bot
2. Knowledge document will be updated with medical cases
3. To reduce randomness set low temperature
4. Give the correct context to the chat bot to give clear answers
